Water systems installation & refurbishment

Water Storage Tanks (New)

Working along side some of the country's leading manufacturers of sectional and one piece cold water storage tanks enables **3C** to offer a comprehensive and guaranteed installation service.

Our project managers have an in depth knowledge of The Water Supply (Water Fittings) Regulations 1999 and this coupled together with highly skilled installation engineers ensures high standards are consistently achieved.

Water Storage Tanks (Refurbished)

In situations where refurbishment of existing tanks is the preferred option, our in-house personnel have extensive experience of surface preparation and application techniques of various types of protective coatings available.

New pre-insulated tank covers are made to measure, pipework modifications are carried out to suit and insulation works complete the package. As with new tank installations, all works are carried out in strict compliance with The Water Supply (Water Fittings) Regulations 1999.

Water System Modifications

3C are able to undertake all types of works including modifications which may be required to bring a water system up to standard. For example the fitting of a shunt pump to prevent stratification of heat through a hot water vessel or the removal of dead leg pipework.

"Working together with the UK's leading tank and protective coatings manufacturers enables 3C to offer a comprehensive and guaranteed service."
